

Azaz Ahamed

Senior Frontend Engineer (Full-Stack)

Senior frontend engineer with 6+ years across the JavaScript/TypeScript ecosystem — deep React/Next.js architecture, performance, and design-system expertise, with a proven record of leading frontend teams and hiring for them. Deliberately deepened backend, distributed-systems, and applied-AI skills (NestJS, PostgreSQL/pgvector, RabbitMQ, RAG/LLM integration) to operate as a frontend-led full-stack engineer: owning features from interface to infrastructure without handoffs.

EXPERIENCE

•RoBenDevs

Full-time

Software Engineer III

02/2025 - Present

- Mentored a frontend engineering team of 5 developers, implementing standardized coding practices and review processes.
- Raised frontend codebase quality by implementing comprehensive unit and integration tests with Cypress, improving code coverage by 45%.
- Cut analytics-dashboard delivery from weeks to days for product teams — integrating Cube.js as the semantic layer feeding the React dashboards.
- Improved frontend performance by up to 20% — tree-shaking and dead-code elimination shrinking bundle sizes and build outputs.
- Kept frontend releases shipping reliably — optimized Docker images and slimmer build artifacts made deployments more efficient and CI/CD pipelines faster, reducing production deployment failures by 70%.
- Gave the team real-time visibility into production behavior — performance monitoring and alerting with Prometheus, InfluxDB, and Grafana, decreasing MTTR by 60%.
- Made long-running product jobs dependable — introduced Temporal.io task orchestration, improving job reliability by 90%.

•RoBenDevs

Full-time

Software Engineer II

08/2023 - 02/2025

- Led SaaS frontend development using Vite React, Redux Toolkit, and RTK Query.
- Developed and published an in-house design system as an npm package.
- Conducted 15+ interviews for frontend and full-stack mid-senior-level positions.
- Implemented complex datagrids using MUIX datagrid for dynamic comparisons.
- Built real-time features with Socket.IO websocket implementations.
- Established robust testing and CI: Bitbucket CI, Cypress, Jest, and Storybook.
- Streamlined multi-app local development with custom Vite + Nginx configs on Docker Compose.

•Intelligent Machines

Full-time

Software Engineer

04/2020 - 02/2023

- Led front-end development of 3 high-value projects, contributing to 30% of the 2022 yearly revenue.
- Built role-based analytics dashboard applications in React using Redux, SWR, Recharts, and Apex Charts.
- Kept large apps fast under load — implemented API caching, reducing backend server load by 70%.
- Migrated 2 existing projects to TypeScript, improving maintainability and scalability.
- Established and managed CI pipelines, automating deployments for front-end cloud applications.
- Mentored newly recruited engineers and interns through onboarding.

•Intelligent Machines

Internship

Software Engineer Intern

01/2020 - 04/2020

- Built with JavaScript, Express, Passport auth strategies, Firebase, MongoDB, and GCP (Cloud Pub/Sub, Cloud Functions) alongside React applications.

•Upwork

Freelance

Freelance Web Developer

10/2018 - 01/2020

- Maintained a 100% Job Success Score as a front-end-focused freelance developer across 19+ clients in 7 countries.
- Delivered Shopify, WordPress, and React-based websites; expanded expertise in JavaScript, SASS/SCSS, React Native, TypeScript, Docker, and REST APIs.

PROJECTS

•DinoTable — Restaurant Discovery & Real-Time Reservations for Bangladesh

2026, In Progress

Next.js 16 / React 19, Tailwind CSS 4, NestJS 11, PostgreSQL 16 (Drizzle), Redis, BullMQ, Nx Monorepo code private

- OpenTable-class dining discovery and table booking, built Bangla-first for the Dhaka market — every screen bilingual from day one (next-intl), SMS-native confirmations, Ramadan-aware service periods with one-tap Iftar/Sehri presets, and bKash/Nagad deposit flows.
- Owns all three React surfaces — a diner-facing Next.js 16 / React 19 web app (App Router, Tailwind 4, Radix primitives, shared design-token pipeline), a tablet-first restaurant back-office, and a platform-admin console with observability views and an audit explorer.
- Real-time availability and reservations underneath — a modular-monolith NestJS backend with strict bounded contexts (9 domain libraries), BullMQ workers, and a staged evolution path documented in 30+ Architecture Decision Records.
- Ships via a production-grade GitHub Actions pipeline — Nx affected builds with remote caching and enforced branch-protection checks — with Playwright e2e and Vitest unit coverage.
- Drove the build with atelier, a self-authored open-source (MIT) AI-engineering harness — a tool-agnostic AGENTS.md contract with playbook-driven milestones, ADR discipline, and a dial controlling how much code AI writes — the workflow behind the platform's milestone cadence and decision record.

•Pulse — AI-Augmented Team Intelligence Platform

2026

Next.js 16 / React 19, NestJS, PostgreSQL + pgvector, Redis, BullMQ, TypeScript

 Code

- Delivered the platform's entire user surface — two Next.js 16 / React 19 frontends in a pnpm monorepo, kept in lockstep by a shared canonical TypeScript types-and-logic package (enums, DTOs, and domain math identical across both clients and the NestJS backend).
- Shipped a streaming conversational-AI UX — answers token-stream into the browser over Server-Sent Events — backed by a RAG pipeline over team activity history (pgvector HNSW embeddings, cosine similarity with a relevance-score floor, live health-context injection, 20-turn conversational memory).
- Surfaced early-warning team-health signals in the UI via a two-axis affect model (valence + energy) with divergence detection — computed by a hybrid two-stage sentiment engine: synchronous lexicon scoring refined by a deterministic JSON-mode LLM in a BullMQ worker.
- Made enterprise sign-in and live updates seamless — Microsoft Entra ID SSO (MSAL OIDC issuing a session JWT with group-claim RBAC), with transactional event sourcing feeding the queue to pgvector to SSE broadcast pipeline.

•Tabs vs Spaces — Distributed Real-Time Voting Pipeline

2026

Next.js 16, NestJS, RabbitMQ, PostgreSQL (partitioned), Redis, Docker Compose

 Code

- Live tallies update in real time for every connected viewer — Server-Sent Events streamed from a Next.js Node-runtime route handler (Web Streams ReadableStream over Redis) with client auto-reconnect.
- Kept the voting UI responsive under bursty, high-throughput load — votes accepted with a fire-and-forget 202 and published to a durable RabbitMQ topic exchange, decoupling ingestion from persistence.
- Engineered the pipeline's batching consumer — in-memory batches flushed on size threshold or 1-second timeout as single multi-row upserts, with prefetch backpressure, an in-flight-flush guard, and graceful SIGTERM flush-on-shutdown.
- Designed a CQRS-style read/write split — range-partitioned PostgreSQL as durable source of truth with low-latency Redis counters (seeded via SET NX so concurrent workers cannot clobber live counts), plus Prometheus metrics and dependency-gated health checks.

EDUCATION

•Independent University, Bangladesh

M.Sc. in Software Engineering, Project Management & QA — published research in Automated Vulnerability Assessment 2023

•Independent University, Bangladesh

B.Sc. in Computer Science — founding member, IUB Rover & Robotics Club; competed at URC 2017–2018 (US) 2020

SKILLS

Frontend (core): React 19, Next.js (App Router, SSR/RSC), TypeScript, Redux Toolkit / RTK Query, SWR, Tailwind CSS, Vite, HTML, CSS/SCSS

Frontend (senior craft): design systems (Storybook, npm-published component library), testing strategy (Cypress, Jest, Storybook), performance profiling & Core Web Vitals, real-time UX (SSE, WebSockets, auto-reconnect patterns), accessibility

Backend: NestJS, Node.js, PostgreSQL, Redis, RabbitMQ, BullMQ, REST APIs, event-driven architecture, JWT / OIDC SSO

AI Engineering: RAG, pgvector / vector search, embeddings, LLM integration, prompt engineering, agentic engineering workflows (AGENTS.md harnesses, playbook-driven development)

DevOps & Tooling: Docker, GitHub Actions, CI/CD, Nx, pnpm monorepos, GCP, Prometheus / Grafana

Languages: English (Fluent), Bangla (Native)

CERTIFICATES

Cutshort Certified React.js — Advanced (02/2023)

Udacity React Nanodegree (12/2017)
